

SAEHUN SEAN OH

Sr. Data & Platform Engineer · Full-Stack Streaming / OTT

Analytics data platform (dbt · Airflow · BigQuery) + 6 yrs across Android, Roku & Chromecast
saehunseanoh@gmail.com · 714.404.9277 · saehunseanoh.me · linkedin.com/in/saehunseanoh

SUMMARY

Software engineer with 10+ years shipping consumer video across Android, Roku, and Chromecast, now owning the dbt / Airflow / BigQuery analytics platform ODK Media runs its business on. Product-minded, focused on building products that genuinely help the people who use them. Quick and adaptable across the stack: self-taught the Chromecast platform to ship two production receivers, then moved into data engineering. Communicates clearly across product and offshore teams, and ships end to end from design through release and certification.

SKILLS

Kotlin, Java, TypeScript, Python, SQL · dbt, Airflow, BigQuery, Kafka, AWS · Android (Jetpack Compose, ExoPlayer), Roku (SceneGraph, BrightScript, BrighterScript), Chromecast (CAF Web Receiver) · HLS, CSAI, SSAI, Mux · AI-assisted dev (Claude Code, ChatGPT) · Korean (bilingual)

EXPERIENCE

ODK Media *Streaming / OTT · OnDemandKorea (ODK/ODKR) & Amasian* 2020 – Present

Sr. Data & Platform Engineer

2026 – Present

- **Own ODK's analytics data platform** (dbt / Airflow / BigQuery): established the standards and data-modeling conventions for a new analytics pipeline, and migrated core viewership models off ad-hoc BigQuery scheduled queries into version-controlled, tested dbt pipelines.
- Built a daily 3-way viewership-hours validation reconciling Kafka, GA4, and Mux, and **optimized it from a 186 GB scan to 1.5 GB per run (~99% less)**.
- Delivered **audience segmentation** (content-affinity and language pools, unauthenticated-audience sizing, and ID5 identity analysis) to support addressable-advertising strategy; built the Publica ad-impression analytics feed powering an internal business intelligence tool.
- Designed and shipped the **Amagi revenue-share settlement system**: dbt settlement marts, Airflow DAGs with hold-until-clean gating, an anomaly-detector suite, monthly reporting, and an interactive Slack bot (Bolt on AWS Lambda) that lets non-engineers investigate, explain, and acknowledge data-quality issues via slash commands.
- **Pioneered AI-assisted development at ODK** as an early adopter: advocated for adopting Claude and ChatGPT, and authored shared CLAUDE.md configurations and reusable Claude Code skills now used across the engineering team.

Chromecast Engineer (self-initiated side project)

2026

- With no prior Cast or web background, self-taught the CAF Web Receiver and built **two production Chromecast receivers from scratch in TypeScript** (ODKR and Amasian), deployed on Vercel.
- Implemented server-side ad-insertion behavior (pre-roll on resume, ad-boundary seek snapping, subtitle clearing) and optimizations for legacy low-memory devices (720p capping, heap monitoring, memory-leak fixes); wrote the sender-side Cast integration in the Android apps.

Roku Engineer

2024 – 2026

- Primary Roku engineer for both apps (BrighterScript / SceneGraph); delivered a full **deep-linking implementation** across episode, movie, series, and live content and carried it through Roku certification.
- Shipped EPG promo banners with QR-code panels, “More to Watch” live recommendations with pagination, and standardized Mux metadata; built a shared, versioned Roku data library consumed as a submodule with automated sync and linting tooling; automated the Roku build with GitHub Actions.

Project Coordinator / Technical Liaison, CTV Apps

2024 – 2025

- Point of contact between ODK's US office and an offshore team in Vietnam building smart-TV apps across **LG webOS, Samsung Tizen, Vizio, Amazon Fire TV, and Android TV**.
- Managed requirements, scope, schedules, and releases across five CTV platforms and time zones simultaneously (translating product needs into engineering work and reviewing deliverables) while continuing hands-on Roku development.

Android Engineer

2020 – 2024

- Built the first-generation OnDemandKorea Android app, then led the ground-up **v2 Kotlin / Jetpack Compose rewrite**: drove a major player refactor and standardized live and VOD playback event handling.
- Integrated Mux video-performance analytics, wiring player state (fullscreen, channel switching, error handling) into the analytics layer, and third-party ad SDKs (PubMatic OpenWrap header bidding); built a OneSignal notification system driving 18K+ app visits/month.
- Sustained **99% crash-free across 2M+ monthly view hours** via a Firebase + Slack live-monitoring setup; integrated Google Play & Roku Billing with backend purchase validation.

Smule

2016 – 2020

Senior Android Application Developer

- Maintained a **99% crash-free rate across ~13M installs** via close Firebase Crashlytics monitoring; led core projects and code reviews without sacrificing velocity.
- Built reusable, scalable custom Views and dynamic content lists (RecyclerView / Adapter / ViewHolder); integrated OkHttp/Retrofit, Picasso, ExoPlayer, MoPub ads, and Facebook/Twitter/Snapchat/YouTube sharing APIs; led the codebase transition from Java to Kotlin and set coding conventions.

DiscreteUnits

2016 – 2017

Android Application Developer

- Built a restaurant ordering app (menu browsing, tab open/close, in-app ordering); integrated Parse, Facebook, Clover, and Stripe for user credentials, catalog, and payments.

MaXentric

2015 – 2016

Android Application Developer

- Built the MaXJacket front-end app replacing Motorola radio hardware with VoIP alongside P25; used GPS/Google Maps and Android sensors; optimized and debugged the app to raise crash-free users by 40%.
